- $\,$ A. Congruent distribution. In the realm of nonparametric
- 2 statistics, the relative differences, or orders, of robust esti-
- 3 mators are of primary importance. A conclusion from this
- $_4$ principle is that when there is a shift in the parameters of the
- 5 underlying distribution, all nonparametric estimates should
- $_{6}$ asymptotically change in the same direction, if they are esti-
- 7 mating the same attribute of the distribution. Otherwise, if
- 8 the mean indicates an increase in the location of the distri-
- $_{\rm 9}$ $\,$ bution, but the median indicates a decrease, a contradiction
- arises. However, while such contradiction is impossible for any
- 11 *LL*-statistics in a location-scale distribution, as discussed in
- $_{12}$ $\,$ the previous article, it is possible in a shape-scale distribution.
